

## Exercise Sheet 6 - Lecture 6

- If  $X \sim N(200, 20^2)$ , calculate
  - $P(X < 210)$
  - $P(X < 195)$
  - $P(X > 215)$
  - $P(185 < X < 205)$
  - $a$  such that  $P(X > a) = 0.2$
- The number of accidents on a certain railway line occur at an average rate of one every 2 months. Find the probability that
  - there are 25 or more accidents in 4 years,
  - there are 30 or less accidents in 5 years.
- In a certain country the heights of adult males have mean 170cm and standard deviation 10cm, and the heights of adult females have mean 160cm and standard deviation 8cm; for each sex the distribution of heights approximates closely to a normal probability model. On the hypothesis that height is not a factor in selecting a mate, calculate the probability that
  - a husband and wife selected at random are both taller than 164cm
  - in a randomly selected husband and wife the wife is taller than the husband
  - the average height of a random couple is greater than 168cm.
- 10% of chocolates produced in a factory are mis-shapes. In a sample of 1000 chocolates find the probability that the number of mis-shapes is
  - less than 80
  - between 90 and 115 inclusive
  - 120 or more.
- A sample of 100 apples is taken from a load. The apples have the following distribution of sizes

Diameter to nearest cm	6	7	8	9	10
Frequency	11	21	38	17	13

Determine the mean and standard deviation of these diameters.

Assuming that the distribution is approximately normal with the estimated mean and standard deviation find the range of size of apples for packing, if 5% are to be rejected as too small and 5% are to be rejected as too large.

(Please Turn Over)

**Exam Paper Questions** The table below lists past exam paper *question numbers* that involve the Normal distribution (useful for revision). NB. bracketed question numbers indicate that only part of the question involves the Normal distribution.

	Human Sciences	Psychology		
Year	TT	MT	HT	TT
2001	4			4
2000	5	3 4		5
1999	4	5	(3)	4
1998	3			3
1997			4
