February 28, 2018

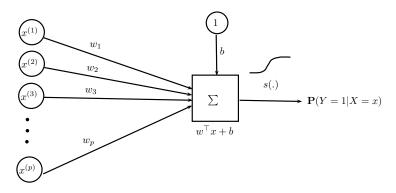

## **Neural Networks**

#### Biological inspiration

- Basic computational elements: neurons.
- Receives signals from other neurons via dendrites.
- Sends processed signals via axons.
- Axon-dendrite interactions at synapses.
- $10^{10} 10^{11}$  neurons.
- $10^{14} 10^{15}$  synapses.

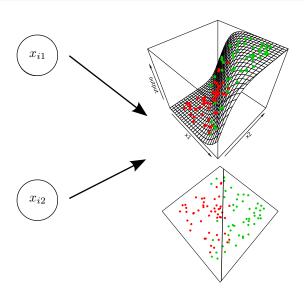

### Single Neuron Classifier

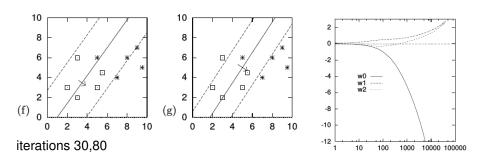

- activation  $w^{\top}x + b$  (linear in inputs x)
- activation/transfer function s gives the output/activity (potentially nonlinear in x)
- ullet often called **bias** (not to be confused with other biases we discussed!)
- common nonlinear activation function  $s(a) = \frac{1}{1+e^{-a}}$ : logistic regression
- learn w and b via gradient descent

## Single Neuron Classifier

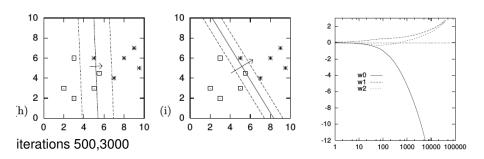

i is the index of a training point.

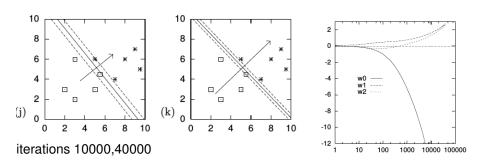

#### Overfitting

#### Overfitting

#### Overfitting

#### prevent overfitting by:

- early stopping: just halt the gradient descent
- regularization:  $L_2$ -regularization called **weight decay** in neural networks literature.

### Multilayer Networks

- Data vectors  $x \in \mathbb{R}^p$ , binary labels  $y \in \{0, 1\}$ .
- inputs  $\boldsymbol{x} = [x_1, \dots, x_p]^{\top}$
- output

$$\hat{y} = \mathbb{P}(Y = 1|X = \boldsymbol{x})$$

hidden unit activities

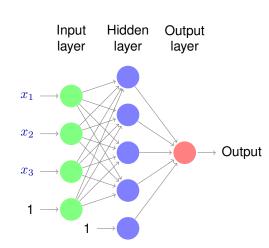

$$h_1,\ldots,h_m$$

 Compute hidden unit activities:

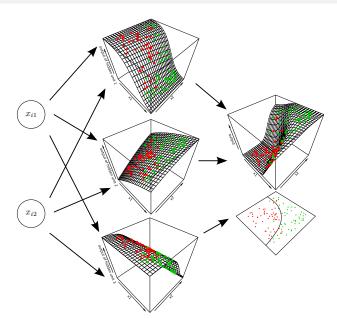

$$h_{\ell} = s \left( b_{\ell}^h + \sum_{j=1}^p w_{j\ell}^h x_j \right)$$

Compute output probability:

$$\hat{y} = s \left( b^o + \sum_{\ell=1}^m w_k^o h_\ell \right)$$

## Multilayer Networks

#### Training a Neural Network

• Objective function:  $L_2$ -regularized log-loss

$$J = -\sum_{i=1}^{n} y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i) + \frac{\lambda}{2} \left( \sum_{jl} (w_{jl}^h)^2 + \sum_{l} (w_l^o)^2 \right)$$

where

$$\hat{y}_i = s \left( b^o + \sum_{l=1}^m w_l^o h_{il} \right)$$
  $h_{il} = s \left( b_l^h + \sum_{j=1}^p w_{jl}^h x_{ij} \right)$ 

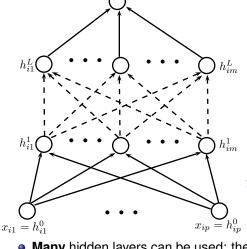

• Optimize parameters  $\theta = \{b^h, w^h, b^o, w^o\}$ , where  $b^h \in \mathbb{R}^m$ ,  $w^h \in \mathbb{R}^{p \times m}$ ,  $b^o \in \mathbb{R}$ ,  $w^o \in \mathbb{R}^m$  with gradient descent.

$$\begin{split} \frac{\partial J}{\partial w_l^o} &= \lambda w_l^o + \sum_{i=1}^n \frac{\partial J}{\partial \hat{y}_i} \frac{\partial \hat{y}_i}{\partial w_l^o} = \lambda w_l^o + \sum_{i=1}^n (\hat{y}_i - y_i) h_{il}, \\ \frac{\partial J}{\partial w_{jl}^h} &= \lambda w_{jl}^h + \sum_{i=1}^n \frac{\partial J}{\partial \hat{y}_i} \frac{\partial \hat{y}_i}{\partial h_{il}} \frac{\partial h_{il}}{\partial w_{jl}^h} = \lambda w_{jl}^h + \sum_{i=1}^n (\hat{y}_i - y_i) w_l^o h_{il} (1 - h_{il}) x_{ij}. \end{split}$$

- $L_2$ -regularization often called weight decay.
- Multiple hidden layers: Backpropagation algorithm

#### Multiple hidden layers

 $\hat{y}_i = h_i^{L+1}$ 

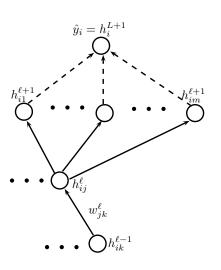

$$h_i^{\ell+1} = \underline{s} \left( W^{\ell+1} h_i^{\ell} \right)$$

- $W^{\ell+1}=\left(w_{jk}^{\ell}\right)_{jk}$ : weight matrix at the  $(\ell+1)$ -th layer, weight  $w_{jk}^{\ell}$  on the edge between  $h_{ik}^{\ell-1}$  and  $h_{ij}^{\ell}$
- <u>s</u>: entrywise (logistic) transfer function

$$\hat{y}_i = \underline{s} \left( W^{L+1} \underline{s} \left( W^L \left( \cdots \underline{s} \left( W^1 x_i \right) \right) \right) \right)$$

 Many hidden layers can be used: they are usually thought of as forming a hierarchy from low-level to high-level features.

#### Backpropagation

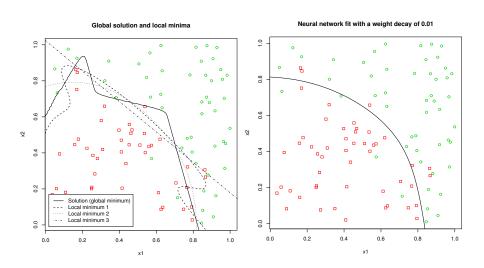

$$J = -\sum_{i=1}^{n} y_i \log h_i^{L+1} + (1 - y_i) \log(1 - h_i^{L+1})$$

ullet Gradients wrt  $h_{ij}^\ell$  computed by recursive applications of chain rule, and propagated through the network backwards.

$$\begin{array}{lcl} \frac{\partial J}{\partial h_i^{L+1}} & = & -\frac{y_i}{h_i^{L+1}} + \frac{1 - y_i}{1 - h_i^{L+1}} \\ \\ \frac{\partial J}{\partial h_{ij}^{\ell}} & = & \sum_{r=1}^{m} \frac{\partial J}{\partial h_{ir}^{\ell+1}} \frac{\partial h_{ir}^{\ell+1}}{\partial h_{ij}^{\ell}} \\ \\ \frac{\partial J}{\partial w_{jk}^{\ell}} & = & \sum_{i=1}^{n} \frac{\partial J}{\partial h_{ij}^{\ell}} \frac{\partial h_{ij}^{\ell}}{\partial w_{jk}^{\ell}} \end{array}$$

#### **Neural Networks**

R package implementing neural networks with a single hidden layer: nnet.

#### **Dropout Training of Neural Networks**

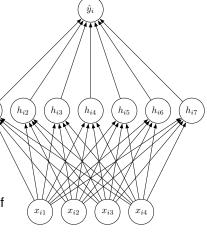

- Neural network with single layer of hidden units:
  - Hidden unit activations:

$$h_{ik} = s \left( b_k^h + \sum_{j=1}^p W_{jk}^h x_{ij} \right)$$

Output probability:

$$\hat{y}_i = s \left( b^o + \sum_{k=1}^m W_k^o h_{ik} \right)$$

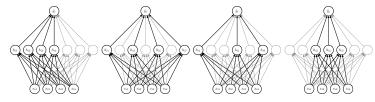

- Large, overfitted networks often have co-adapted hidden units.
- What each hidden unit learns may in fact be useless, e.g. predicting the negation of predictions from other units.
- Can prevent co-adaptation by randomly dropping out units from network.

Hinton et al (2012).

### **Dropout Training of Neural Networks**

Model as an ensemble of networks (more on ensembles later):

- Weight-sharing among all networks: each network uses a subset of the parameters of the full network (corresponding to the retained units).
- Training by stochastic gradient descent: at each iteration a network is sampled from ensemble, and its subset of parameters are updated.
- ullet Biological inspiration:  $10^{14}$  weights to be fitted in a lifetime of  $10^9$  seconds
  - Poisson spikes as a regularization mechanism which prevents co-adaptation: Geoff Hinton on Brains, Sex and Machine Learning

#### **Dropout Training of Neural Networks**

Classification of phonemes in speech.

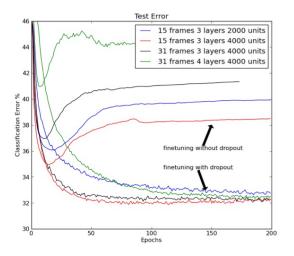

Figure from Hinton et al.

#### Neural Networks – Variations

Other loss functions can be used, e.g. for regression:

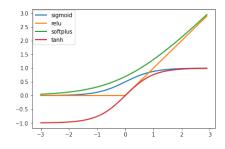

$$\sum_{i=1}^{n} |y_i - \hat{y}_i|^2$$

For multiclass classification, use **softmax** outputs:

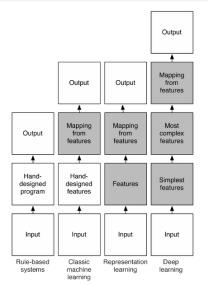

$$\hat{y}_{ik} = \frac{\exp(b_k^o + \sum_{\ell} w_{lk}^o h_{i\ell})}{\sum_{k'=1}^K \exp(b_{k'}^o + \sum_{\ell} w_{lk'}^o h_{i\ell})} \quad L(y_i, \hat{y}_i) = -\sum_{k=1}^K \mathbb{1}(y_i = k) \log \hat{y}_{ik}$$

$$L(y_i, \hat{y}_i) = -\sum_{k=1}^{\infty} \mathbb{1}(y_i = k) \log \hat{y}_{ik}$$

- Other activation functions can be used:
  - rectified linear unit (ReLU):  $s(z) = \max(0, z)$
  - softplus:  $s(z) = \log(1 + \exp(z))$
  - tanh:  $s(z) = \tanh(z)$

### Deep Convolutional Neural Networks

- Input is a 2D image,  $X \in \mathbb{R}^{p \times q}$ .
- Convolution: detects simple object parts or features Weights  $W^m$  now correspond to a **filter** to be learned typically much smaller than the input thus encouraging sparse connectivity.
- Pooling and Sub-sampling: replace the output with a summary statistic of the nearby outputs, e.g. max-pooling (allows invariance to small translations in the input).

#### Neural Networks - Discussion

- Nonlinear hidden units introduce modelling flexibility, hierarchical representations.
- In contrast to user-introduced nonlinearities, features are global, and can be learned to maximize predictive performance.
- Neural networks with a single hidden layer and sufficiently many hidden units can model arbitrarily complex functions.
- Highly flexible framework, with many variations to solve different learning problems and introduce domain knowledge.
- Optimization problem is **not convex**, and objective function can have many local optima, plateaus and ridges.
- On large scale problems, often use stochastic gradient descent, along with a whole host of techniques for optimization, regularization, and initialization.
- Explosion of interest in the field recently and many new developments not covered here, especially by Geoffrey Hinton, Yann LeCun, Yoshua Bengio, Andrew Ng and others. See also http://deeplearning.net/.
